

Amendments to the Specification:

Please amend the specification as follows, where added text is underlined and deleted text is in strike-out font:

Please replace the paragraph beginning at page 14, last paragraph, as follows:

--Figure 9 is a flow diagram of this logic behavior linking process according to an embodiment of the present invention. At block 900, the maker defines the page global variable and functions for a selected page of the book. A simplified example of play audio and video functions is show at block 902. At block 904, the maker defines the script function for a selected object. A fragment of a script function example is shown at block 906. At block 908, the maker packages the linkage information and the script function as a script module and stores the linkage information and the script function in the action library. Subsequently, when the user is interacting with a current page of the book, the player loads the script module for the current page from the action library at block 910. At block 912, the player adds the script module 914 to the script engine. In one embodiment, the script engine may be VBScript or Jscript as provided by versions of the Windows operating system commercially available from Microsoft Corporation. At block 916, the player may call the script function when the user selects an object linked to a script. The call to the script function results in the script engine processing the script associated with the selected object. At block 918, the action is performed as a result of the operation of the script engine.--

Please replace the paragraph beginning at page 16, second to last paragraph, as follows:

-- Returning back to Figure 5, at block 512, the maker stores all linkage information, multimedia files, and other actions/responses into the appropriate places in the multimedia database, the book content database, and the action library. At block 514, in one embodiment, the maker generates a preview of the page in the book for verification by the publisher or user that the intended linkages have been stored. At block 516, the maker packages the databases ~~518~~ 318 for subsequent distribution to the user's computer system.--
